Abstract. In this paper, we introduce some new notions called soft $SIg\delta$ s - closed sets, soft $SIg\delta$ s - open sets. We obtain several characterizations and some of their properties. Also, we investigate its relationship with other types of sets. 2010 Mathematics Subject Classification. 54A10, 54A20, 54C08. **Key words and phrases:** soft sets, soft topological spaces, soft regular open, soft δ -cluster point, soft $SIg\delta$ s -closed.

1 Introduction

The concept of soft sets was first introduced by Molodtsov [12] in 1999 as a general mathematical tool for dealing with uncertain objects. In [12, 13], Molodtsov [12] first suggested the idea of soft sets in 1999 as a generic mathematical technique for handling ambiguous things. In [12, 13], Molodtsov successfully implemented the soft theory in a number of areas, including probability, theory of measurement, Riemann integration, game theory, operations research, and smoothness of functions.

With the presentation of soft set operations [11], the properties and applications of soft set theory have undergone a growing amount of research [3, 8, 13]. By incorporating the concepts of fuzzy sets, numerous intriguing applications of soft set theory have recently been explored [1, 2, 4, 9, 10, 11, 13]. The operations of the soft sets are redefined to create the soft set theory, and a uni-int decision-making procedure is used was constructed by using these new operations [5]. 2011 saw the start of the study of soft topological spaces by Shabir and Naz [15]. On the collection of soft sets over X , they defined soft topology. As a result, they established the many properties of fundamental concepts in soft topological spaces, such as soft open and soft closed sets, soft subspace, soft interior, soft closure, soft neighbourhood of a point, soft separation axioms, soft regular spaces, and soft normal spaces. Hussain and Ahmad [6] looked into the characteristics of a point's soft interior, soft closure, soft exterior, and soft neighbourhood. Also, they defined and discussed the characteristics of soft interior, soft exterior, and soft border, which are crucial for further study of soft topology and will reinforce the theoretical underpinnings of soft topology.spaces.

In this paper, we introduce some new notions called soft $\text{Sig}\delta$ s -closed sets and soft $\text{Sig}\delta$ s -open sets. We obtain several characterizations and some of their properties. Also, we investigate its relationship with other types of sets.

2 Preliminaries

In this section, we present some basic definitions and results which are needed in further study of this paper which may be found in earlier studies. Throughout this paper, X refers to an initial universe, E is a set of parameters, $\wp(X)$ is the power set of X , and $A \subseteq E$, Y refers to an initial universe, K is a set of parameters, $B \subseteq K$ and Z refers to an initial universe, L is a set of parameters, $C \subseteq L$.

Definition 2.1. [12] A soft set FA over the universe X is defined by the set of ordered pairs

$$FA = \{(e, FA(e)) : e \in E, FA(e) \in \wp(X)\}$$

where $FA: E \rightarrow \wp(X)$, such that $FA(e) = \emptyset$, if $e \in A \subseteq E$ and $FA(e) = \emptyset$ if $e \notin A$. The family of all soft sets over X is denoted by $SS(X)$.

Definition 2.2. [11] The soft set $F\emptyset$ over a common universe set X is said to be null soft set, denoted by \emptyset . Here $F\emptyset(e) = \emptyset, \forall e \in E$.

Definition 2.3. [11] A soft set FA over X is called an absolute soft set, denoted by A^{\sim} , if $e \in A, FA(e) = X$.

Definition 2.4. [11] Let FA, GB be soft sets over a common universe set X . Then FA is a soft subset of GB , denoted $FA \subseteq GB$ if $FA(e) \subseteq GB(e), \forall e \in E$.

Definition 2.5. [11] Let FA, GB be soft sets over a common universe set X . The union of FA and GB , is a soft set HC defined by $HC(e) = FA(e) \cup GB(e), \forall e \in E$, where $C = A \cup B$.

That is, $HC = FA \cup GB$.

Definition 2.6. [11] Let FA, GB be soft sets over a common universe set X . The intersection of FA and GB , is a soft set HC defined by $HC(e) = FA(e) \cap GB(e), \forall e \in E$, where $C = A \cap B$.

That is, $HC = FA \cap GB$.

Definition 2.7. [15] The complement of the soft set FA over X , denoted by F^c is defined by $A^c(e) = X - FA(e), \forall e \in E$.

Definition 2.8. [15] Let FA be a soft set over X and $x \in X$. We say that $x \in FA$ if $x \in FA(e), \forall e \in A$.

For any $x \in X, x \notin FA$ if $x \notin FA(e)$ for some $e \in A$.

Definition 2.9. [15] For two soft points xe and ye' over a common universe X , we say that the points are different points if $x \neq y$ or $e \neq e'$.

Definition 2.10. [18] The soft set $FA \in SS(X)$ is called a soft point in $SS(X)$ if there exist $x \in X$ and $e \in E$ such that $F(e) = \{x\}$ and $F(ec) = \emptyset$ for each $ec \in E - \{e\}$ and the soft point FA is denoted by xe .

Definition 2.11. [15] A soft topology τ is a family of soft sets over X satisfying the following properties. (1) \emptyset, X^{\sim} belong to τ . (2) The union of any number of soft sets in τ belongs to τ . (3) The intersection of any two soft sets in τ belongs to τ . The triplet (X, τ, E) is called a soft topological space.

Definition 2.12. [14] Let (X, τ, E) be a soft topological space over X . Then

(1) The members of τ are called soft open sets in X .

(2) A soft set FA over X is said to be a soft closed set in X if $F^c \in \tau$.

(3) A soft set FA is said to be a soft neighborhood of a point $x \in X$ if $x \in FA$ and FA^{\wedge} is soft open in (X, τ, E)

(4) The soft interior of a soft set FA is the union of all soft open subsets of FA . The soft interior of FA is denoted by $\text{int}(FA)$.

(5) The soft closure of FA is the intersection of all soft closed super sets of FA . The soft closure of FA is denoted by $\text{cl}(FA)$ or \overline{FA} .

Definition 2.13. [17] A soft set FA in a soft topological space (X, τ, E) is said to be a soft regular open (resp. soft regular closed) if $FA = \text{int}(\text{cl}(FA))$ (resp. $FA = \text{cl}(\text{int}(FA))$).

The set of all soft regular open (resp. soft regular closed) sets of (X, τ, E) is denoted by $\text{SRO}(X)$ (resp. $\text{SRC}(X)$).

Definition 2.14. Let I be a non-null collection of soft sets over a universe X with the same set of parameters E . Then $I \subset \text{SS}(X)$ is called a soft ideal on X with the same set E if

- (1) $FA \in I$ and $GA \in I \Rightarrow FA \cup GA \in I$.
- (2) $FA \in I$ and $GA \subset FA \Rightarrow GA \in I$.

Definition 2.15. Let (X, τ, E) be a soft topological space and I be a soft ideal over X with the same set of parameters E . Then $F^* = \bigcup \{O_x \in X : O_x \cap FA \in I, \text{ for all } O_x \in \tau\}$ is called the soft local function of FA with respect to I and τ , where O_x is a τ -open set containing x .

Theorem 2.16. Let I and J be any two soft ideals with the same set of parameters E on a soft topological space (X, τ, E) . Let $FA, GA \in \text{SS}(X)$. Then

- (1) $(\emptyset)^* = \emptyset$.
- (2) $FA \subset GA \Rightarrow F^* \subset G^*$.
- (3) $I \subset J \Rightarrow F^*(J) \subset F^*(I)$.
- (4) $F^* \subset \text{cl}(FA)$, where cl is the soft closure w.r.t τ .
- (5) F^* is τ -closed soft set.
- (6) $(F^*)^* \subset F^*$.
- (7) $(FA \cup GA)^* = F^* \cup G^*$.

Definition 2.17. Let (X, τ, E) be a soft topological space, I be a soft ideal over X with the same set of parameters E and $\text{cl}^* : \text{SS}(X) \rightarrow \text{SS}(X)$ be the soft closure operator. Then there exists a unique soft topology over X with the same set of parameters E , finer than τ , called the τ -soft topology, defined by $\tau^* = \{FA \in \text{SS}(X) : \text{cl}^*(X - FA) = X - FA\}$.

Definition 2.18. [7] Let FA be a soft subset of soft topological space (X, τ, E) . Then

(1) $x \in E$ is called a soft δ -cluster point of FA if $FA \cap \text{int}(\text{cl}(UA)) \neq \emptyset$ for every soft open set UA containing x .

(2) The family of all soft δ -cluster point of FA is called the soft δ -closure of FA and is denoted by $\text{cl}_\delta(FA)$.

(3) A soft subset FA is said to be soft δ -closed if $\text{cl}_\delta(FA) = FA$. The complement of a soft δ -closed set of X is said to be soft δ -open.

Lemma 2.19. [7] Let FA be a soft subset of soft topological space (X, τ, E) . Then, the following properties hold:

- (1) $\text{int}(\text{cl}(FA))$ is soft regular open,
- (2) Every soft regular open set is soft δ -open,
- (3) Every soft δ -open set is the union of a family of soft regular open sets.
- (4) Every soft δ -open set is soft open.

Proposition 2.20. [7] Intersection of two soft regular open sets is soft regular open.

Lemma 2.21. [7] Let FA and GA be soft subsets of soft topological space (X, τ, E) . Then, the following properties hold.

- (1) $FA \subset \text{cl}_\delta(FA)$,
- (2) If $FA \subset GA$, then $\text{cl}_\delta(FA) \subset \text{cl}_\delta(GA)$,
- (3) $\text{cl}_\delta(FA) = \bigcap \{GA \in \text{SS}(X) : FA \subset GA \text{ and } GA \text{ is soft } \delta\text{-closed}\}$,
- (4) If $(FA)_\alpha$ is a soft δ -closed set of X for each $\alpha \in \Delta$, then $\bigcap \{(FA)_\alpha : \alpha \in \Delta\}$ is soft δ -closed,
- (5) $\text{cl}_\delta(FA)$ is soft δ -closed.

Theorem 2.22. [7] Let (X, τ, E) be a soft topological space and $\tau\delta = \{FA \in SS(X) : FA \text{ is a soft } \delta\text{-open set}\}$. Then $\tau\delta$ is a soft topology weaker than τ .

Definition 2.23. A soft subset FA of a soft topological space (X, τ, E) is said to be

(1) soft preopen if $FA \subset \text{int}(\text{cl}(FA))$, (2) soft semiopen if $FA \subset \text{cl}(\text{int}(FA))$, (3) soft α -open if $FA \subset \text{int}(\text{cl}(\text{int}(FA)))$.

The complement of a soft preopen (resp. soft semiopen, soft α -open) set is called a soft preclosed (resp. soft semiclosed, soft α -closed) set. The set of all soft preopen (resp. soft semiopen, soft α -open, soft preclosed, soft semiclosed, soft α -closed) sets of (X, τ, E) is denoted by $SPO(X)$ (resp. $SSO(X)$, $S\alpha O(X)$, $SPC(X)$, $SSC(X)$, $S\alpha C(X)$).

$\text{intS}(FA) = \{\cup UA : UA \subset FA \text{ and } UA \text{ is soft semiopen sets}\}$ and $\text{clS}(FA) = \{\cap GA : FA \subset GA \text{ and } GA \text{ is soft semiclosed}\}$.

Definition 2.24. A soft subset FA of a soft topological space (X, τ, E) is said to be

(1) soft regular-I -open if $FA = \text{int}(\text{cl}^*(FA))$,
(2) soft pre-I -open if $FA \subset \text{int}(\text{cl}^*(FA))$, (3) soft semi-I -open if $FA \subset \text{cl}^*(\text{int}(FA))$, (4) soft α -I -open if $FA \subset \text{int}(\text{cl}^*(\text{int}(FA)))$.

The complement of a soft regular-I -open (resp. soft pre-I -open, soft semi-I -open, soft α -I -open) set is called a soft regular-I -closed (resp. soft pre-I -closed, soft semi-I -closed, soft α -I -closed) set. The set of all soft regular-I -open (resp. soft pre-I -open, soft semi-I -open, soft α -I -open, soft regular-I -closed, soft pre-I -closed, soft semi-I -closed, soft α -I -closed) sets of (X, τ, E, I) is denoted by $SRI O(X)$ (resp. $SPI O(X)$, $SSI O(X)$, $S\alpha I O(X)$, $SRI C(X)$, $SPI C(X)$, $SSI C(X)$, $S\alpha I C(X)$).

Definition 2.25. $SI\text{int}(FA) = \{\cup UA : UA \subset FA \text{ and } UA \text{ is soft semi-I -open sets}\}$ and $SI\text{cl}(FA) = \{\cap GA : FA \subset GA \text{ and } GA \text{ is soft semi-I -closed sets}\}$.

A soft subset FA is soft semi-I -closed if and only if $SI\text{cl}(FA) = FA$.

Definition 2.26. Let FA be a soft subset of a soft topological space (X, τ, E) . The set $\cap\{UA \in \tau : FA \subset UA\}$ is called the kernel of FA and is denoted by $\ker(FA)$.

3 On Soft $SIg\delta s$ -closed sets

Definition 3.1. A soft set FA over soft ideal topological space X is called soft generalized δ semi- closed (briefly soft $SIg\delta s$ -closed) set if $SI\text{cl}(FA) \subset GA$ whenever $FA \subset GA$ and GA is soft δ -open over X .

A soft set FA over X is called soft generalized δ semi-open (briefly soft $SIg\delta s$ -open) set if $FA \subset \text{int}(\text{cl}(FA))$.

The family of all soft $SIg\delta s$ -closed subsets over X is denoted by $SIg\delta s -C(X)$ and soft $SIg\delta s$ -open subsets over X is denoted by $SIg\delta s -O(X)$.

Example 3.2. Let $X = \{a, b\}$, $E = \{e1, e2\}$, $\tau = \{X^{\sim}, \emptyset, AE, BE, CE\}$ and $I = \{\emptyset, DE\}$ where $A(e1) = \emptyset$, $A(e2) = \{a\}$ (hereafter represent as $(\emptyset, \{a\})$) $B(e1) = \emptyset$, $B(e2) = \{b\}$ (hereafter represent as $(\emptyset, \{b\})$) $C(e1) = \emptyset$, $C(e2) = X$ (hereafter represent as (\emptyset, X)) then soft $SIg\delta s$ -closed sets are \emptyset , X^{\sim} , $(\emptyset, \{a\})$, $(\emptyset, \{b\})$, (\emptyset, X) , $(\{a\}, \emptyset)$, $(\{a\}, \{a\})$, $(\{a\}, \{b\})$, $(\{a\}, X)$, $(\{b\}, \emptyset)$, $(\{b\}, \{a\})$, $(\{b\}, \{b\})$, $(\{b\}, X)$, (X, \emptyset) , $(X, \{a\})$, $(X, \{b\})$.

Theorem 3.3. Every soft closed set is soft $SIg\delta s$ -closed.

Proof: Let FA be a soft closed set over X . Let GA be a soft δ -open set such that $FA \subseteq GA$. Since FA is soft closed, that is $\text{cl}(FA) = FA$, $\text{cl}(FA) \subseteq GA$. But $SI\text{cl}(FA) \subseteq \text{cl}(FA) \subseteq GA$. Therefore $SI\text{cl}(FA) \subseteq GA$. Hence FA is soft $SIg\delta s$ -closed over X .

Remark 3.4. (1) Every soft semi-I -closed (resp. soft pre-I -closed, soft α -I -closed) set is soft $SIg\delta s$ -closed.

(2) Every soft δ -closed set is $SIg\delta s$ -closed.

Example 3.5. From Example 3.2, the soft subset $(\emptyset, \{a\})$ is $Ig\delta s$ -closed but not soft pre-I -closed, soft semi-I -closed, soft α -I -closed and soft δ -closed.

Definition 3.6. A soft point x_e over X is said to be a soft limit point of soft set FA if and only if $GA \cap (FA - \{x_e\}) = \emptyset$ for every soft open set GA containing x_e . The set of all soft limit points of FA is called soft derived set of FA and is denoted by $D(FA)$.

Definition 3.7. A soft point x_e over X is said to be a soft semi-I-limit point of soft set FA if and only if $GA \cap (FA - \{x_e\}) = \emptyset$ for every soft semi-I-open set GA containing x_e . The set of all soft semi-I-limit points of FA is called soft semi-I-derived set of FA and is denoted by $DS(FA)$.

Lemma 3.8. For any soft subset FA over X , if $D(FA) \subset DS(FA)$, then $cl(FA) = SIsc(FA)$.

Proof: For any soft subset FA over X , $DS(FA) \subset D(FA)$ is always true. By hypothesis $D(FA) \subset DS(FA)$. Therefore $D(FA) = DS(FA)$. That is $FA \cup cl(FA) = FA \cup SIsc(FA)$, which implies $cl(FA) = SIsc(FA)$.

Theorem 3.9. If FA and GA are soft $SIg\delta$ -closed sets such that $D(FA) \subset DS(FA)$ and $D(GA) \subset DS(GA)$. Then $FA \cup GA$ is $SIg\delta$ -closed set over X .

Proof: Let FA and GA be soft $SIg\delta$ -closed subsets over X such that $D(FA) \subset DS(FA)$ and $D(GA) \subset DS(GA)$. Therefore by lemma 3.8, $SIsc(FA) = cl(FA)$ and $SIsc(GA) = cl(GA)$. Let HA be a soft δ -open set such that $FA \cup GA \subset HA$, then $FA \subset HA$ and $GA \subset HA$. Since FA and GA are soft $SIg\delta$ -closed sets, $SIsc(FA) \subset HA$ and $SIsc(GA) \subset HA$. Since $SIsc(FA \cup GA) \subset cl(FA \cup GA) = cl(FA) \cup cl(GA) = SIsc(FA) \cup SIsc(GA) \subset HA \cup HA = HA$. Thus, $SIsc(FA \cup GA) \subset HA$. This shows that, $FA \cup GA$ is soft $SIg\delta$ -closed set over X .

Theorem 3.10. Let FA be a soft $SIg\delta$ -closed set over X . Then $SIsc(FA) - FA$ does not contain any non empty soft δ -closed set.

Proof: Let FA be a soft $SIg\delta$ -closed set and HA be a soft δ -closed set over X such that $HA \subset SIsc(FA) - FA$. This implies $HA \subset SIsc(FA)$ and $HA \subset X - FA$ implies $FA \subset X - HA$. Now FA is soft $SIg\delta$ -closed set and $X - HA$ is soft δ -open set containing FA . Therefore $SIsc(FA) \subset X - HA$. That is $HA \subset X - SIsc(FA)$. This implies $HA \subset SIsc(FA) \cap (X - SIsc(FA)) = \emptyset$. This shows $HA = \emptyset$.

Theorem 3.11. A soft $SIg\delta$ -closed set FA is soft semi-I-closed if and only if $SIsc(FA) - FA$ is soft δ -closed set.

Proof: Suppose a soft $SIg\delta$ -closed set FA is soft semi-I-closed. Then $SIsc(FA) = FA$. This implies $SIsc(FA) - FA = \emptyset$, which is soft δ -closed.

Conversely, $SIsc(FA) - FA$ is soft δ -closed and FA is soft $SIg\delta$ -closed set. Now $SIsc(FA) - FA$ is soft δ -closed subset of itself. Therefore by Theorem 3.10, $SIsc(FA) - FA = \emptyset$. That is $SIsc(FA) = FA$, implies FA is soft semi-I-closed.

Theorem 3.12. If FA is soft $SIg\delta$ -closed and $FA \subset GA \subset SIsc(FA)$, then GA is soft $SIg\delta$ -closed set.

Proof: Let $GA \subset HA$ and HA is soft δ -open. Since $FA \subset GA$ implies $FA \subset HA$ and FA is soft $SIg\delta$ -closed, implies $SIsc(FA) \subset HA$. By hypothesis $GA \subset SIsc(FA)$, which implies $SIsc(GA) \subset SIsc(FA) \subset HA$, that implies $SIsc(GA) \subset HA$. Therefore GA is soft $SIg\delta$ -closed set.

Theorem 3.13. If FA is soft δ -open and soft $SIg\delta$ -closed then FA is soft semi-I-closed and hence soft regular open.

Proof: Suppose FA is soft δ -open and soft $SIg\delta$ -closed. Since $FA \subset FA$, implies $SIsc(FA) \subset FA$. But $FA \subset SIsc(FA)$ is always true. Therefore $SIsc(FA) = FA$. That is FA is soft semi-I-closed and hence regular open, because every soft δ -open set is soft open and every soft open and soft semi-I-closed set is soft regular open.

Theorem 3.14. For a soft ideal topological space X the following are equivalent

- (1) Every soft δ -open set over X is soft semi-I-closed.
- (2) Every soft subset over X is soft $SIg\delta$ -closed.

Proof: (1) \Rightarrow (2), Suppose (1) holds. Let FA be any soft subset over X and GA be a soft δ -open such that $FA \subset GA$. This implies $SI_{scl}(FA) \subset S Iscl(GA)$. By hypothesis, GA is soft semi-I-closed implies $SI_{scl}(GA) = GA$. Hence $SI_{scl}(FA) \subset GA$. Therefore FA is soft $SI_{g\delta s}$ -closed set over X .

(2) \Rightarrow (1), Suppose (2) holds and GA is soft δ -open set over X . By (2), GA is soft $SI_{g\delta s}$ -closed. Therefore $SI_{scl}(GA) \subset GA$. But $GA \subset S Iscl(GA)$ is always true. Therefore $GA = S Iscl(GA)$ and hence GA is soft semi-I-closed.

Theorem 3.15. For any soft point x_e over X , the set $X - \{x_e\}$ is soft $SI_{g\delta s}$ -closed set or soft δ -open.

Proof: Suppose $X - \{x_e\}$ is not soft δ -open. Then X^* is the only soft δ -open set containing $X - \{x_e\}$. This implies $SI_{scl}(X - \{x_e\}) \subset X^*$. Hence $X - \{x_e\}$ is soft $SI_{g\delta s}$ closed set.

Theorem 3.16. If a soft subset FA over X is soft $SI_{g\delta s}$ -closed set, then $cl_{\delta}(\{x_e\}) \cap FA = \emptyset$ for each $x_e \in S Iscl(FA)$.

Proof: Suppose FA is a soft $SI_{g\delta s}$ -closed set and $x_e \in S Iscl(FA)$. If possible $cl_{\delta}(\{x_e\}) \cap FA \neq \emptyset$. Then $FA \subset X - cl_{\delta}(\{x_e\})$ and $X - cl_{\delta}(\{x_e\})$ is soft δ -open set containing FA . Since FA is soft $SI_{g\delta s}$ -closed set, implies $SI_{scl}(FA) \subset X - cl_{\delta}(\{x_e\})$, which is contradiction to $x_e \in S Iscl(FA)$. Therefore, $cl_{\delta}(\{x_e\}) \cap FA = \emptyset$.

Theorem 3.17. If every soft semi-open set is soft semi-I-closed, then every soft subset over X is soft $SI_{g\delta s}$ -closed.

Proof: Suppose $FA \subset HA$ where HA is soft δ -open over X . Since every soft δ -open set is soft semi-open, HA is soft semi-open. By hypothesis HA is soft semi-I-closed. Hence $SI_{scl}(FA) \subset HA$.

Therefore FA is soft $SI_{g\delta s}$ -closed set. Since FA is arbitrary, every soft subset of X is soft $SI_{g\delta s}$ -closed set.

Theorem 3.18. Let FA be a soft $SI_{g\delta s}$ -closed set. Then $FA = S Iscl(S Isint(FA))$ if and only if $SI_{scl}(S Isint(FA)) - FA$ is soft δ -closed.

Proof: If $FA = S Iscl(S Isint(FA))$, then $SI_{scl}(S Isint(FA)) - FA = \emptyset$, which is soft δ -closed. Hence $SI_{scl}(S Isint(FA)) - FA$ is soft δ -closed. Conversely, let $SI_{scl}(S Isint(FA)) - FA$ be soft δ -closed. Since $SI_{scl}(S Isint(FA)) - FA \subset S Iscl(FA) - FA$, implies $SI_{scl}(FA) - FA$ contains the soft δ -closed set $SI_{scl}(S Isint(FA)) - FA$. By Theorem 3.11, $SI_{scl}(S Isint(FA)) - FA = \emptyset$, which implies $SI_{scl}(S Isint(FA)) = FA$.

Theorem 3.19. A soft subset FA is soft $SI_{g\delta s}$ -closed set if and only if $SI_{scl}(FA) \subset \ker(FA)$.

Proof: Suppose FA is soft $SI_{g\delta s}$ -closed set, then $SI_{scl}(FA) \subset GA$ whenever $FA \subset GA$ and GA is soft δ -open. Let $x_e \in S Iscl(FA)$. If $x_e \notin \ker(FA)$, then there exist a soft δ -open set GA containing FA such that $x_e \notin X^*$. Since GA is soft δ -open set containing FA , implies $x_e \notin S Iscl(FA)$, which is a contradiction. Therefore $x_e \in \ker(FA)$. Conversely, let $SI_{scl}(FA) \subset \ker(FA)$. If GA is soft δ -open set containing FA , then $\ker(FA) \subset GA$, which implies $SI_{scl}(FA) \subset GA$. Therefore FA is soft $SI_{g\delta s}$ -closed set.

Theorem 3.20. A soft set FA is soft $SI_{g\delta s}$ -open if and only if $HA \subset S Isint(FA)$, whenever HA is soft δ -closed and $HA \subset FA$.

Proof: Let FA be a soft $SI_{g\delta s}$ -open set. Suppose $HA \subset FA$, where HA is soft δ -closed. Then, $X - FA$ is soft $SI_{g\delta s}$ -closed set contained in soft δ -open set $X - HA$. This implies $SI_{scl}(X - FA) \subset X - HA$. Therefore $X - S Isint(FA) \subset X - HA$, which implies $HA \subset S Isint(FA)$.

Conversely, suppose $HA \subset S Isint(FA)$, whenever $HA \subset FA$ and HA is soft δ -closed set. Then $X - S Isint(FA) \subset X - HA$, whenever $X - FA \subset X - HA$ and $X - HA$ is soft δ -open. This implies $SI_{scl}(X - FA) \subset X - HA$ whenever $X - FA \subset X - HA$ and $X - HA$ is soft δ -open. This shows that $X - FA$ is soft $SI_{g\delta s}$ -closed over X , hence FA is soft $SI_{g\delta s}$ -open set over X .

Theorem 3.21. If FA is a soft $SIg\delta s$ -open set over X , then $GA = X^{\sim}$ and soft $SI\text{int}(FA) \cup (X - FA) \subset GA$. Whenever GA is soft δ -open.

Proof: Let FA be a soft $SIg\delta s$ -open set and GA be soft δ -open over X such that $SI\text{int}(FA) \cup X - FA \subset GA$. Then $X - GA \subset X - (S\text{Isint}(FA) \cup X - FA) \subset (X - S\text{Isint}(FA)) \cap FA$. That is $X - GA \subset (S\text{Iscl}(X - FA) - (X - FA))$. Since $X - FA$ is soft $SIg\delta s$ -closed, by Theorem 3.11 $SI\text{iscl}(X - FA) - (X - FA)$ does not contain any non empty soft δ -closed set, which implies $X - GA = \emptyset$. Hence $GA = X^{\sim}$.

Theorem 3.22. If $SI\text{int}(FA) \subset GA \subset FA$ and FA is soft $SIg\delta s$ -open set, then GA is soft $SIg\delta s$ -open.

Proof: Let FA be a soft $SIg\delta s$ -open set and $SI\text{int}(FA) \subset GA \subset FA$ implies $X - FA \subset X - GA \subset X - S\text{Isint}(FA)$, that is $X - FA \subset X - GA \subset S\text{Iscl}(X - FA)$. Now $X - FA$ is soft $SIg\delta s$ -closed set. Hence by Theorem 3.12, $X - GA$ is soft $SIg\delta s$ -closed and hence GA is soft $Ig\delta s$ -open set.

Theorem 3.23. Let X be soft ideal topological space and FA, GA be soft subsets over X . If GA is soft $SIg\delta s$ -open and if $SI\text{int}(GA) \subset FA$, then $FA \cap GA$ is soft $SIg\delta s$ -open.

Proof: Let FA and GA be arbitrary soft subsets over X and GA is soft $SIg\delta s$ -open such that $SI\text{int}(GA) \subset FA$. This implies $SI\text{int}(GA) \cap GA \subset FA \cap GA \subset GA$, since $SI\text{int}(GA) \subset GA$, implies $SI\text{int}(GA) \subset FA \cap GA \subset GA$. Since GA is soft $SIg\delta s$ -open, $FA \cap GA$ is soft $SIg\delta s$ -open.

Theorem 3.24. Let $SSO(X)$ be closed under finite intersections. If FA and GA are soft $SIg\delta s$ -open, then $FA \cap GA$ is soft $SIg\delta s$ -open.

Proof: Assume $SSO(X)$ is closed under finite intersection. Let FA and GA be soft $SIg\delta s$ -open sets such that $X - (FA \cap GA) = (X - FA) \cup (X - GA) \subset OA$, where OA is soft δ -open. Then $X - FA \subset OA$ and $X - GA \subset OA$. Since FA and GA are soft $SIg\delta s$ -open, $X - FA$ and $X - GA$ are soft $SIg\delta s$ -closed sets. Therefore $SI\text{iscl}(X - FA) \subset OA$ and $SI\text{iscl}(X - GA) \subset OA$. This implies $SI\text{iscl}(X - FA) \cup S\text{Iscl}(X - GA) \subset OA$. Now $SI\text{iscl}(X - (FA \cap GA)) = S\text{Iscl}((X - FA) \cup (X - GA)) \subset S\text{Iscl}(X - FA) \cup S\text{Iscl}(X - GA) \subset OA$. This implies $X - (FA \cap GA)$ is soft $SIg\delta s$ -closed and hence $FA \cap GA$ is soft $SIg\delta s$ -open set.

Theorem 3.25. If FA is soft $SIg\delta s$ -closed over X then $SI\text{iscl}(FA) - FA$ is soft $SIg\delta s$ -open.

Proof: If FA is soft $SIg\delta s$ -closed set and GA be soft δ -closed set such that $GA \subset S\text{Iscl}(FA) - FA$. This implies $GA = \emptyset$ by Theorem 3.10. Hence $GA \subset S\text{Isint}(S\text{Iscl}(FA) - FA)$. Therefore $SI\text{iscl}(FA) - FA$ is soft $SIg\delta s$ -open set.

Theorem 3.26. Let X be a soft ideal topological space and FA be soft set over X . Then $SI\text{iscl}(FA) - FA$ is soft $SIg\delta s$ -closed if and only if $FA \cup (X - S\text{Iscl}(FA))$ is soft $SIg\delta s$ -open.

Proof: Let $GA = S\text{Iscl}(FA) - FA$. Then $X - GA = (X - S\text{Iscl}(FA)) \cup FA$. Since GA is soft $SIg\delta s$ -closed, $X - GA$ is soft $SIg\delta s$ -open and hence $(X - S\text{Iscl}(FA)) \cup FA$ is soft $SIg\delta s$ -open.

Conversely, let $HA = (X - S\text{Iscl}(FA)) \cup FA$ be soft $SIg\delta s$ -open. Hence $X - HA = S\text{Iscl}(FA) - FA$, which is soft $SIg\delta s$ -closed, by hypothesis. This implies $X - S\text{Iscl}(FA)$ is soft $SIg\delta s$ -closed.

Theorem 3.27. Let X be a soft ideal topological space and FA be soft set over X . If $SI\text{iscl}(FA) - FA$ is soft $SIg\delta s$ -closed, then $FA = GA \cap S\text{Iscl}(A)$, for some soft $SIg\delta s$ -open set GA .

Proof: Given $SI\text{iscl}(FA) - FA$ is soft $SIg\delta s$ -closed set. Therefore $GA = X - (S\text{Iscl}(FA) - FA)$ is soft $SIg\delta s$ -open. Then $GA \cap S\text{Iscl}(FA) = (X - (S\text{Iscl}(FA) - FA)) \cap S\text{Iscl}(FA) = ((X - S\text{Iscl}(FA)) \cup FA) \cap S\text{Iscl}(FA) = ((X - S\text{Iscl}(FA)) \cap S\text{Iscl}(FA)) \cup (FA \cap S\text{Iscl}(FA)) = \emptyset \cup FA = FA$.

Definition 3.28. A soft subset FA over soft topological space X is called a soft neighbourhood (briefly, soft nhd) of a soft point x_e over X , if there exists a soft open set

GA such that $xe \in GA \subset FA$. The collection of all soft nhd's of $xe \in FA$ is called soft nhd system of xe and is denoted by $N(xe)$.

Definition 3.29. A soft subset FA over soft ideal topological space X is called a soft $SIg\delta s$ - neighbourhood (briefly, soft $SIg\delta s$ -nhd) of a soft point xe over X , if there exists a soft $SIg\delta s$ -open set GA such that $xe \in GA \subset FA$. The collection of all soft $SIg\delta s$ -nhd's of $xe \in FA$ is called soft $SIg\delta s$ -nhd system of xe and is denoted by $SIg\delta s$ - $N(xe)$.

Remark 3.30. Every soft nhd of xe over X is a soft $SIg\delta s$ -nhd of xe , because every soft open set is a soft $SIg\delta s$ -open set. But converse need not be true as seen from following example.

Example 3.31. In example 3.2, it is clear that $X^{\sim}, (\{a\}, \emptyset), (\{a\}, \{a\}), (\{a\}, b), (\{a\}, X), (X, \emptyset), (X, \{a\}), (X, \{b\})$ are $Ig\delta s$ -nhd of $(\{a\}, \emptyset)$ but X^{\sim} is only soft nhd of $(\{a\}, \emptyset)$.

Lemma 3.32. An arbitrary union of soft $SIg\delta s$ -nhd's of a soft point xe is again a soft $SIg\delta s$ -nhd of that soft point.

Proof: Let $\{FA_i : i \in I\}$ be an arbitrary collection of soft $SIg\delta s$ -nhd's of xe over X . Since for each $i \in I$, FA_i is soft $SIg\delta s$ -nhd of xe , there exists soft $SIg\delta s$ -open set GA_i such that $xe \in GA_i \subset FA_i$. But for each $i \in I$, $FA_i \subset UFA_i$, therefore $xe \in GA_i \subset UFA_i$, which implies UFA_i is again soft $SIg\delta s$ -nhd of xe .

Theorem 3.33. Let xe be any arbitrary soft point of a soft ideal topological space X . Then $SIg\delta s$ - $N(xe)$ satisfies the following properties.

- (1) $SIg\delta s$ - $N(xe) = \emptyset$.
- (2) if $NA \in SIg\delta s$ - $N(xe)$ then $xe \in NA$.
- (3) if $NA \in SIg\delta s$ - $N(xe)$ and $NA \subset MA$ then $MA \in SIg\delta s$ - $N(xe)$.

Proof: (1) Since for each soft point xe over X , X^{\sim} is a soft $SIg\delta s$ -open set. Therefore $xe \in X^{\sim} \subset X^{\sim}$, implies X^{\sim} is soft $SIg\delta s$ -nhd of xe , hence $X^{\sim} \in SIg\delta s$ - $N(xe)$. Therefore $SIg\delta s$ - $N(xe) = \emptyset$. (2) Given $NA \in SIg\delta s$ - $N(xe)$, implies NA is a $SIg\delta s$ -nhd of xe , which implies there exists a soft $SIg\delta s$ -open set GA such that $xe \in GA \subset NA$. This implies, $xe \in NA$.

(3) Given $NA \in SIg\delta s$ - $N(xe)$ implies there exists soft $SIg\delta s$ -open set GA such that $xe \in GA \subset NA$ and $NA \subset MA$, which implies $xe \in GA \subset MA$. This shows that $MA \in SIg\delta s$ - $N(xe)$.

Theorem 3.34. Let FA be a soft subset over X . Then FA is soft $SIg\delta s$ -open set if and only if FA is soft $SIg\delta s$ -nhd of each of its soft points.

Proof: Let FA be any soft $SIg\delta s$ -open set over X . Then for each soft point xe over X , $xe \in FA \subset FA$, implies FA is soft $SIg\delta s$ -nhd of xe . Since xe is arbitrary soft point of FA , implies FA is soft $SIg\delta s$ -nhd of each of its soft points. On the other hand, FA is soft $SIg\delta s$ -nhd of each of its soft points, which implies for each $xe \in FA$, there exists a soft $SIg\delta s$ -open set G_{xe} such that $xe \in G_{xe} \subset FA$... (1) Now claim that $FA = U_{xe \in FA} G_{xe}$. Suppose if $xe \in FA$, there exists at least one soft $SIg\delta s$ -open set G_{xe} such that $xe \in G_{xe} \subset U_{xe \in FA} G_{xe}$. Therefore $FA \subset U_{xe \in FA} G_{xe}$... (2) Again if $ye \in U_{xe \in FA} G_{xe}$ implies $ye \in G_{xe}$ for some $xe \in FA$. From (1), $ye \in FA$. Therefore $U_{xe \in FA} G_{xe} \subset FA$... (3). From (2) and (3) it follows that, $FA = U_{xe \in FA} G_{xe}$. Thus each G_{xe} is soft $SIg\delta s$ -open set and arbitrary union of soft $SIg\delta s$ -open sets is again soft $SIg\delta s$ -open set. Therefore FA is soft $SIg\delta s$ -open set.

Corollary 3.35. If FA is a soft $SIg\delta s$ -closed subset over X and $xe \in X - FA$, then there exists a soft $Ig\delta s$ -nhd NA of xe such that $NA \cap FA = \emptyset$.

Proof: Given FA is soft $SIg\delta s$ -closed set, implies $X - FA$ is soft $SIg\delta s$ -open set by Theorem

3.34, $X - FA$ is soft $SIg\delta s$ -nhd of each of its soft points. Let $xe \in X - FA$, implies there exists a soft $SIg\delta s$ -open set NA such that $xe \in NA \subset X - FA$, which implies $NA \cap FA = \emptyset$.

Definition 3.36. A soft point xe over X is said to be a soft $SIg\delta s$ -limit point of soft set FA if and only if $GA \cap (FA - \{xe\}) = \emptyset$ for every soft $SIg\delta s$ -open set GA containing xe . The set of all soft $SIg\delta s$ -limit points of FA is called soft $SIg\delta s$ -derived set of FA and is denoted by $SIg\delta s-D(FA)$.

Remark 3.37. Since every soft open set is soft $SIg\delta s$ -open set, it follows from the definition 3.36 that, every soft $SIg\delta s$ -limit point of FA is a limit point of FA . Therefore, $SIg\delta s-D(FA) \subset D(FA)$ where $D(FA)$ is derived set of FA .

Theorem 3.38. Let FA, GA be two soft sets of soft ideal topological space. Then the following properties hold.

- (1) $SIg\delta s-D(\emptyset) = \emptyset$.
- (2) If $FA \subset GA$ then $SIg\delta s-D(FA) \subset SIg\delta s-D(GA)$.
- (3) If $xe \in SIg\delta s-D(FA)$ then $xe \in SIg\delta s-D(FA - \{xe\})$. (4) $SIg\delta s-D(FA) \cup SIg\delta s-D(GA) \subset SIg\delta s-D(FA \cup GA)$. (5) $SIg\delta s-D(FA \cap GA) \subset SIg\delta s-D(FA) \cap SIg\delta s-D(GA)$.

Proof: (1) Let xe be soft point over X and HA be a soft $SIg\delta s$ -open set containing xe . Then

$HA \cap (\emptyset - \{xe\}) = \emptyset$. Therefore for any soft point xe over X , xe is not a soft $SIg\delta s$ -limit point of

\emptyset . Hence $SIg\delta s-D(\emptyset) = \emptyset$.

(2) Let $xe \in SIg\delta s-D(FA)$. Then $HA \cap (FA - \{xe\}) = \emptyset$, for every soft $SIg\delta s$ -open set HA containing xe . Since $FA \subset GA$, implies $HA \cap (GA - \{xe\}) = \emptyset$. This implies $xe \in SIg\delta s-D(GA)$. Thus, $xe \in SIg\delta s-D(FA)$ implies $xe \in SIg\delta s-D(GA)$. Therefore, $SIg\delta s-D(FA) \subset SIg\delta s-D(GA)$.

(3) Let $xe \in SIg\delta s-D(FA)$. Then $HA \cap (FA - \{xe\}) = \emptyset$, for every soft $SIg\delta s$ -open set HA containing xe . This implies every soft $SIg\delta s$ -open set HA containing xe , contains at least one soft point other than xe of $FA - \{xe\}$. Therefore $xe \in SIg\delta s-D(FA - \{xe\})$.

(4) Since $FA \subset FA \cup GA$ and $GA \subset FA \cup GA$ and by (2), $SIg\delta s-D(FA) \subset SIg\delta s-D(FA \cup GA)$ and

$SIg\delta s-D(GA) \subset SIg\delta s-D(FA \cup GA)$. Hence, $SIg\delta s-D(FA) \cup SIg\delta s-D(GA) \subset SIg\delta s-D(FA \cup GA)$.

(5) Since $FA \cap GA \subset FA$ and $FA \cap GA \subset GA$ and by (2), soft $SIg\delta s-D(FA \cap GA) \subset SIg\delta s-D(FA)$ and $SIg\delta s-D(FA \cap GA) \subset SIg\delta s-D(GA)$. Therefore $SIg\delta s-D(FA \cap GA) \subset SIg\delta s-D(FA) \cap SIg\delta s-D(GA)$.

Theorem 3.39. If FA is a soft subset of soft ideal topological space X , then $FA \cup SIg\delta s-D(FA)$ is soft $SIg\delta s$ -closed set.

Proof: To prove $FA \cup SIg\delta s-D(FA)$ is soft $SIg\delta s$ -closed set, it is sufficient to prove $X - (FA \cup SIg\delta s-D(FA))$ is soft $SIg\delta s$ -open. If $X - (FA \cup SIg\delta s-D(FA)) = \emptyset$, then it is clearly soft $SIg\delta s$ -open set. Let $X - (FA \cup SIg\delta s-D(FA)) = \emptyset$ and $xe \in X - (FA \cup SIg\delta s-D(FA))$, implies $xe \notin FA \cup SIg\delta s-D(FA)$. This implies $xe \notin FA$ and $xe \notin SIg\delta s-D(FA)$. Now $xe \notin SIg\delta s-D(FA)$, implies xe is not soft $SIg\delta s$ -limit point of FA . Therefore there exists a soft $SIg\delta s$ -open set HA containing xe such that $HA \cap (FA - \{xe\}) = \emptyset$. Since $xe \notin FA$, implies $HA \cap FA = \emptyset$. This implies $xe \in HA \subset X - FA \dots (1)$. Again HA is soft $SIg\delta s$ -open set and $HA \cap FA = \emptyset$ implies no soft point of HA can be soft $SIg\delta s$ -limit point of FA . This follows $HA \cap SIg\delta s-D(FA) = \emptyset$, implies $xe \in HA \subset X - SIg\delta s-D(FA) \dots (2)$. This shows from (1) and (2), $xe \in HA \subset (X - FA) \cap (X - SIg\delta s-D(FA)) = X - (FA \cup SIg\delta s-D(FA))$. That is $xe \in HA \subset X - (FA \cup SIg\delta s-D(FA))$. This implies $X - (FA \cup SIg\delta s-D(FA))$ is soft $SIg\delta s$ -nhd of each of its soft points. By Theorem 3.34, $X - (FA \cup SIg\delta s-D(FA))$ is soft $SIg\delta s$ -open set and hence $FA \cup SIg\delta s-D(FA)$ is soft $SIg\delta s$ -closed set.

Theorem 3.40. Let X be a soft ideal topological space and FA be soft set over X . Then FA is soft $SIg\delta s$ -closed set if and only if $SIg\delta s-D(FA) \subset FA$.

Proof: Suppose FA is soft $SIg\delta s$ -closed set. If $SIg\delta s -D(FA) = \emptyset$, then the result is obvious. If $SIg\delta s -D(FA) \neq \emptyset$ then $x_e \in S Ig\delta s -D(FA)$, implies $HA \cap (FA - \{x_e\}) = \emptyset$ for every soft $SIg\delta s$ -open set HA containing x_e . If $x_e \in$

FA then $x_e \in X - FA$. Since FA is soft $SIg\delta s$ -closed set and $X - FA$ is soft $SIg\delta s$ -open set containing x_e and not containing any other soft point of FA , which is contradiction to $x_e \in S Ig\delta s -D(FA)$, therefore $x_e \in FA$. Thus, $x_e \in S Ig\delta s -D(FA)$ implies $x_e \in FA$. Hence $SIg\delta s -D(FA) \subset FA$. On the other hand, $SIg\delta s -D(FA) \subset FA$. To prove FA is soft $SIg\delta s$ -closed set; it is equivalent to prove $X - FA$ is soft $SIg\delta s$ -open set. Let $x_e \in X - FA$ implies $x_e \notin FA$. Since $SIg\delta s -D(FA) \subset FA$, implies $x_e \notin S Ig\delta s -D(FA)$, which implies there exists a soft $SIg\delta s$ -open set HA containing x_e such that $HA \cap (FA - \{x_e\}) = \emptyset$. That is $HA \cap FA = \emptyset$ as $x_e \notin FA$, implies, $x_e \in HA \subset X - FA$. Therefore $X - FA$ is soft $SIg\delta s$ -nhd of x_e . Since x_e is arbitrary, $X - FA$ is soft $SIg\delta s$ -nhd of each of its points. By Theorem 3.34, $X - FA$ is soft $SIg\delta s$ -open set. Hence FA is soft $SIg\delta s$ -closed set.

4. Soft $SIg\delta s$ -closure and soft $SIg\delta s$ -interior

Definition 4.1. Let X be a soft ideal topological space and FA be a soft subset over X . Then soft $SIg\delta s$ -closure of FA denoted by $SIg\delta s -cl(FA)$ and defined as the intersection of all soft $SIg\delta s$ -closed sets over X containing FA .

Theorem 4.2. Let FA be any soft subset of soft ideal topological space X . Then

- (1) $SIg\delta s -cl(FA)$ is the smallest soft $SIg\delta s$ -closed superset of FA .
- (2) FA is soft $SIg\delta s$ -closed if and only $SIg\delta s -cl(FA) = FA$.
- (3) $SIg\delta s -cl(FA) = FA \cup S Ig\delta s -D(FA)$.

Proof: (1) Let $\{GA_i : i \in I\}$ be the collection of all soft $SIg\delta s$ -closed subsets over X containing FA . Therefore $SIg\delta s -cl(FA) = \bigcap \{GA_i : i \in I\}$, by the definition of the $SIg\delta s -cl(FA)$. Since the intersection of an arbitrary collection of soft $SIg\delta s$ -closed sets is a soft $SIg\delta s$ -closed set, implies

$\bigcap \{GA_i : i \in I\}$ is soft $SIg\delta s$ -closed set. Therefore $SIg\delta s -cl(FA)$ is a soft $SIg\delta s$ -closed set. Also since $FA \subset GA_i$ for each $i \in I$, implies $FA \subset \bigcap \{GA_i : i \in I\} = S Ig\delta s -cl(FA)$. Thus $SIg\delta s -cl(FA)$ is soft $SIg\delta s$ -closed set containing FA . Also since $SIg\delta s -cl(FA) = \bigcap \{GA_i : i \in I\}$, implies $SIg\delta s -cl(FA) \subset GA_i$ for each $i \in I$. Consequently, $SIg\delta s -cl(FA)$ is the smallest soft $SIg\delta s$ -closed superset of FA .

(2) If FA is soft $SIg\delta s$ -closed set, then obviously it is the smallest soft $SIg\delta s$ -closed superset of FA , therefore it must coincide with $SIg\delta s -cl(FA)$. Hence FA is soft $SIg\delta s$ -closed, implies $SIg\delta s -cl(FA) = FA$. Again if $SIg\delta s -cl(FA) = FA$, then $SIg\delta s -cl(FA)$ is soft $SIg\delta s$ -closed set, so FA is soft $SIg\delta s$ -closed set. Hence FA is soft $SIg\delta s$ -closed if and only $SIg\delta s -cl(FA) = FA$.

(3) By Theorem 3.39, $FA \cup S Ig\delta s -D(FA)$ is a soft $SIg\delta s$ -closed set. Also $FA \subset FA \cup S Ig\delta s -D(FA)$, implies $FA \cup S Ig\delta s -D(FA)$ is a soft $SIg\delta s$ -closed set containing FA . Therefore $SIg\delta s -cl(FA) \subset FA \cup S Ig\delta s -D(FA)$(1). Again $FA \subset S Ig\delta s -cl(FA)$, implies $SIg\delta s -D(FA) \subset S Ig\delta s -D(S Ig\delta s -cl(FA)) \subset S Ig\delta s -cl(FA)$, because $SIg\delta s -cl(FA)$ is soft $SIg\delta s$ -closed set. Hence $FA \cup S Ig\delta s -D(FA) \subset S Ig\delta s -cl(FA)$(2). From (1) and (2), $SIg\delta s -cl(FA) = FA \cup S Ig\delta s -D(FA)$.

Remark 4.3. From the Theorem 4.2 it is clear that $FA \subset S Ig\delta s -cl(FA)$ and also since every soft closed set is soft $SIg\delta s$ -closed, implies $FA \subset S Ig\delta s -cl(FA) \subset cl(FA)$. But the equality does not holds as seen from the following example.

Example 4.4. In Example 3.2, let $FA = (\emptyset, \{a\})$, it is clear that $cl(FA) = (X, \{a\}) \neq SIg\delta s -cl(FA) = (\emptyset, \{a\})$.

Theorem 4.5. For any soft subsets FA and GA of a space X the following properties hold(1) $SIg\delta s-cl(\emptyset) = \emptyset$, $SIg\delta s-cl(X^{\sim}) = X^{\sim}$

and $SIg\delta s-cl(SIg\delta s-cl(FA)) = SIg\delta s-cl(FA)$.(2) If $FA \subset GA$, then $SIg\delta s-cl(FA) \subset SIg\delta s-cl(GA)$.

(3) $SIg\delta s-cl(FA) \cup SIg\delta s-cl(GA) \subset SIg\delta s-cl(FA \cup GA)$.

(4) $SIg\delta s-cl(FA \cap GA) \subset SIg\delta s-cl(FA) \cap SIg\delta s-cl(GA)$.Proof: (1) Since each one of the sets \emptyset , X^{\sim} and $SIg\delta s-cl(FA)$ being soft $SIg\delta s$ -closed, implies byTheorem 4.2, $SIg\delta s-cl(\emptyset) = \emptyset$, $SIg\delta s-cl(X^{\sim}) = X^{\sim}$

and $SIg\delta s-cl(SIg\delta s-cl(FA)) = SIg\delta s-cl(FA)$.(2) Let $FA \subset GA$ then $FA \subset GA \subset SIg\delta s-cl(GA)$. This implies $SIg\delta s-cl(GA)$ is soft $SIg\delta s$ -closed uperset of FA. But $SIg\delta s-cl(FA)$ is the smallest soft $SIg\delta s$ -closed superset of FA. Therefore, $SIg\delta s-cl(FA) \subset SIg\delta s-cl(GA)$.

(3) Since $FA \subset FA \cup GA$ and $GA \subset FA \cup GA$. From (2), $SIg\delta s-cl(FA) \subset SIg\delta s-cl(FA \cup GA)$ and

$SIg\delta s-cl(GA) \subset SIg\delta s-cl(FA \cup GA)$. Therefore, $SIg\delta s-cl(FA) \cup SIg\delta s-cl(GA) \subset SIg\delta s-cl(FA \cup GA)$. (4) Since $FA \cap GA \subset FA$ and $FA \cap GA \subset GA$. From (2), $SIg\delta s-cl(FA \cap GA) \subset SIg\delta s-cl(FA)$ and

$SIg\delta s-cl(FA \cap GA) \subset SIg\delta s-cl(GA)$. Therefore, $SIg\delta s-cl(FA \cap GA) \subset SIg\delta s-cl(FA) \cap SIg\delta s-cl(GA)$.

Theorem 4.6. Let FA be a soft subset of a space X. Then $x_e \in SIg\delta s-cl(FA)$ if and only if

$HA \cap FA = \emptyset$ for every soft $SIg\delta s$ -open set HA containing x_e .

Proof: Let $x_e \in SIg\delta s-cl(FA)$. Suppose there exists soft $SIg\delta s$ -open set HA containing x_e such that $FA \cap HA = \emptyset$. Then $FA \subset X - HA$. Now $X - HA$ is soft $SIg\delta s$ -closed set containing FA implies $SIg\delta s-cl(FA) \subset X - HA$ and $x_e \notin X - HA$ implies $x_e \notin SIg\delta s-cl(FA)$. This is contradiction to hypothesis. Hence $FA \cap HA = \emptyset$.

Conversely, let $HA \cap FA = \emptyset$ for every soft $SIg\delta s$ -open set HA containing x_e . Suppose $x_e \notin SIg\delta s-cl(FA)$. There exists a soft $SIg\delta s$ -closed set OA containing FA such that $x_e \notin OA$. This implies $FA \cap (X - OA) = \emptyset$ and $X - OA$ is soft $SIg\delta s$ -open set containing x_e .

This is contradiction to the hypothesis. Therefore $x_e \in SIg\delta s-cl(FA)$.

Definition 4.7. A soft point x_e over X is called soft $SIg\delta s$ -interior of FA if there exists a soft $SIg\delta s$ -open set HA over X such that $x_e \in HA \subset FA$.

In other words, x_e is soft $SIg\delta s$ -interior point of FA if FA is soft $SIg\delta s$ -nhd of x_e . The set of all soft $SIg\delta s$ -interior points of FA is denoted by $SIg\delta s-int(FA)$.

Remark 4.8. Since every soft open set is soft $SIg\delta s$ -open set, implies every interior point of FA is soft $SIg\delta s$ -interior point of FA. Therefore, $int(FA) \subset SIg\delta s-int(FA)$ for any soft set FA over X. But the equality does not holds as seen from the following example.

Example 4.9. In the example 3.2, Let $FA = (\{a\}, \emptyset)$ it is clear that $int(FA)$ is \emptyset but $SIg\delta s-int(FA)$ is $(\{a\}, \emptyset)$ is not a soft subset of \emptyset .

Theorem 4.10. Let FA be any soft subset of a soft ideal topological space X. Then $SIg\delta s-int(FA)$ is the union of all soft $SIg\delta s$ -open subsets over X.

Proof: Let HA be the collection of all soft $SIg\delta s$ -open subsets over X. To prove that $SIg\delta s-int(FA) = \cup\{HA \in SIg\delta s-O(X) : HA \subset FA\}$; If $x_e \in SIg\delta s-int(FA)$, then x_e is soft $SIg\delta s$ -interior point of FA, so there exists a soft $SIg\delta s$ -open subset HA over X containing x_e such that $x_e \in HA \subset FA$. Consequently, $x_e \in \cup\{HA \in SIg\delta s-O(X) : HA \subset FA\}$. This shows that, $SIg\delta s-int(FA) \subset \cup\{HA \in SIg\delta s-O(X) : HA \subset FA\}$(1) Again if $x_e \in \cup\{HA \in SIg\delta s-O(X) : HA \subset FA\}$, then x_e is contained in some soft $SIg\delta s$ -open subset HA of FA, that is $x_e \in HA \subset FA$. Therefore x_e is soft $SIg\delta s$ -interior point of FA and so $x_e \in SIg\delta s-int(FA)$. Thus, $\cup\{HA \in SIg\delta s-O(X) : HA \subset FA\} \subset SIg\delta s-int(FA)$ (2). Hence from (1) and (2), $SIg\delta s-int(FA) = \cup\{HA \in SIg\delta s-O(X) : HA \subset FA\}$.

Theorem 4.11. Let X be a soft ideal topological space and FA and GA be soft subsets over X . Then the following properties hold.

- (1) $SIg\delta s\text{-int}(FA)$ is a soft $SIg\delta s\text{-open}$ set.
- (2) $SIg\delta s\text{-int}(FA)$ is largest soft $SIg\delta s\text{-open}$ set contained in FA .
- (3) FA is soft $SIg\delta s\text{-open}$ if and only if $FA = S Ig\delta s\text{-int}(FA)$.
- (4) $SIg\delta s\text{-int}(\emptyset) = \emptyset$ and $SIg\delta s\text{-int}(X^{\sim}) = X^{\sim}$.
- (5) If $FA \subset GA$ then $SIg\delta s\text{-int}(FA) \subset S Ig\delta s\text{-int}(GA)$.
- (6) $SIg\delta s\text{-int}(FA) \cup S Ig\delta s\text{-int}(GA) \subset S Ig\delta s\text{-int}(FA \cup GA)$. (7) $SIg\delta s\text{-int}(FA \cap GA) \subset S Ig\delta s\text{-int}(FA) \cap S Ig\delta s\text{-int}(GA)$. (8) $SIg\delta s\text{-int}(S Ig\delta s\text{-int}(FA)) = S Ig\delta s\text{-int}(FA)$.

Proof: (1) Since union of soft $SIg\delta s\text{-open}$ sets is again soft $SIg\delta s\text{-open}$ set and $SIg\delta s\text{-int}(FA)$ is union of soft $SIg\delta s\text{-open}$ sets contained in FA . Therefore $SIg\delta s\text{-int}(FA)$ is soft $SIg\delta s\text{-open}$ set.

(2) Let HA be any soft $SIg\delta s\text{-open}$ subset of FA and if $x_e \in HA$, then $x_e \in HA \subset FA$. Since HA being soft $SIg\delta s\text{-open}$ set, implies FA is soft $SIg\delta s\text{-nhd}$ of x_e . Therefore x_e is soft $SIg\delta s\text{-interior}$ point of FA . Thus $x_e \in HA$ implies $x_e \in S Ig\delta s\text{-int}(FA)$. This implies every soft $SIg\delta s\text{-open}$ subset of FA is contained in $SIg\delta s\text{-int}(FA)$. Therefore $SIg\delta s\text{-int}(FA)$ is the largest soft $SIg\delta s\text{-open}$ set contained in FA .

(3) Let FA be a soft $SIg\delta s\text{-open}$ set. Since $FA \subset FA$, implies FA is identical with largest soft $SIg\delta s\text{-open}$ subset of FA . By (2), $SIg\delta s\text{-int}(FA)$ is the largest soft $SIg\delta s\text{-open}$ subset of FA . Therefore $FA = S Ig\delta s\text{-int}(FA)$. (4) Since X^{\sim}

and \emptyset are soft $SIg\delta s\text{-open}$ sets, by (3) $SIg\delta s\text{-int}(X^{\sim}) = X^{\sim}$

and $SIg\delta s\text{-int}(\emptyset) = \emptyset$. (5) Let $FA \subset GA$ and $x_e \in S Ig\delta s\text{-int}(FA)$, implies there exists a soft $SIg\delta s\text{-open}$ set HA such that $x_e \in HA \subset FA$, which implies $x_e \in HA \subset FA \subset GA$. That is, $x_e \in HA \subset GA$. Therefore x_e is soft $SIg\delta s\text{-interior}$ of GA . That is $x_e \in S Ig\delta s\text{-int}(GA)$. Thus $x_e \in S Ig\delta s\text{-int}(FA)$ implies $x_e \in S Ig\delta s\text{-int}(GA)$. Therefore $SIg\delta s\text{-int}(FA) \subset S Ig\delta s\text{-int}(GA)$.

(6) Since $FA \subset FA \cup GA$ and $GA \subset FA \cup GA$, then by (5), $SIg\delta s\text{-int}(FA) \subset S Ig\delta s\text{-int}(FA \cup GA)$ and $SIg\delta s\text{-int}(GA) \subset S Ig\delta s\text{-int}(FA \cup GA)$, implies $SIg\delta s\text{-int}(FA) \cup S Ig\delta s\text{-int}(GA) \subset S Ig\delta s\text{-int}(FA \cup GA)$. (7) Since $FA \cap GA \subset FA$ and $FA \cap GA \subset GA$, then from (5), $SIg\delta s\text{-int}(FA \cap GA) \subset S Ig\delta s\text{-int}(FA)$ and $SIg\delta s\text{-int}(FA \cap GA) \subset S Ig\delta s\text{-int}(GA)$. Thus, $SIg\delta s\text{-int}(FA \cap GA) \subset S Ig\delta s\text{-int}(FA) \cap S Ig\delta s\text{-int}(GA)$.

(8) By (3), FA is soft $SIg\delta s\text{-open}$ if and only if $FA = S Ig\delta s\text{-int}(FA)$ and by (1), $SIg\delta s\text{-int}(FA)$ is soft $SIg\delta s\text{-open}$ set. Therefore, $SIg\delta s\text{-int}(S Ig\delta s\text{-int}(FA)) = S Ig\delta s\text{-int}(FA)$.

Theorem 4.12. If FA is a soft subset over soft ideal topological space X , then

- (1) $SIg\delta s\text{-cl}(X - FA) = X - S Ig\delta s\text{-int}(FA)$. (2) $SIg\delta s\text{-int}(X - FA) = X - S Ig\delta s\text{-cl}(FA)$. (3) $SIg\delta s\text{-int}(FA) = X - S Ig\delta s\text{-cl}(X - FA)$. (4) $SIg\delta s\text{-cl}(FA) = X - S Ig\delta s\text{-int}(X - FA)$.

Proof: (1) Consider, $SIg\delta s\text{-cl}(X - FA) = \bigcap \{GA_i : GA_i \text{ is soft } SIg\delta s\text{-closed set over } X \text{ and } X - FA \subset GA_i\} = \bigcap \{GA_i : X - GA_i \text{ is soft } SIg\delta s\text{-open subset over } X \text{ and } X - GA_i \subset FA\} = X - \bigcup_i (X - GA_i)$, where $X - GA_i$ is soft $SIg\delta s\text{-open}$ set over X and $X - GA_i \subset FA$, therefore $X - (\text{union of all soft } SIg\delta s\text{-open sets contained in } FA) = X - S Ig\delta s\text{-int}(FA)$.

(2) Consider, $X - S Ig\delta s\text{-cl}(FA) = X - \bigcap \{GA_i : GA_i \text{ is soft } SIg\delta s\text{-closed subset over } X \text{ and } FA \subset GA_i\} = \bigcup \{X - GA_i : X - GA_i \text{ is soft } SIg\delta s\text{-open subset over } X \text{ and } X - GA_i \subset X - FA\} = \text{union of all soft } SIg\delta s\text{-open sets contained in } X - FA = S Ig\delta s\text{-int}(X - FA)$.

(3) Obtained by replacing FA by $X - FA$ in result (2). (4) Obtained by replacing FA by $X - FA$ in result (1).

Theorem 4.13. If FA is soft subset of soft ideal topological space X , then $SIg\delta s\text{-int}(FA)$ equals to the set of all those soft points FA which are not soft $SIg\delta s\text{-limit}$ points of $(X - FA)$. That is, $SIg\delta s\text{-int}(FA) = FA - S Ig\delta s\text{-D}(X - FA)$.

Proof: Let $x_e \in FA - S I\delta s -D(X - FA)$, implies $x_e \in FA$ and $x_e \notin S I\delta s -D(X - FA)$. This implies x_e is not soft $S I\delta s$ -limit point of $(X - FA)$, therefore there exists a soft $S I\delta s$ -open set HA containing x_e but not contains the soft points of $(X - FA)$. That is $HA \cap (X - FA) = \emptyset$. This implies $HA \subset FA$. Thus $x_e \in HA \subset FA$ implies $x_e \in S I\delta s -int(FA)$. Therefore $FA - S I\delta s - D(X - FA) \subset S I\delta s -int(FA)...(1)$. On the other hand, if $x_e \in S I\delta s -int(FA)$ then $x_e \in FA$ as $S I\delta s -int(FA) \subset FA$ and also $S I\delta s -int(FA)$ is soft $S I\delta s$ -open set containing x_e and not containing any other points of $(X - FA)$, implies x_e is not soft $S I\delta s$ -limit point of $(X - FA)$. Since x_e is arbitrary implies, every soft point of $S I\delta s -int(FA)$ is soft limit point of FA but not a soft limit point of $(X - FA)$. This shows that $x_e \in FA - S I\delta s -D(X - FA)$. Therefore $S I\delta s -int(FA) \subset FA - S I\delta s - D(X - FA)...(2)$. From (1) and (2) $S I\delta s -int(FA) = FA - S I\delta s -D(X - FA)$. Hence $S I\delta s -int(FA)$ equals to the set of all those soft points FA which are not soft $S I\delta s$ -limit points of $(X - FA)$.

Theorem 4.14. For the soft subsets FA and GA of soft ideal topological space X , following statements are true

$$(1) S I\delta s -int(X - FA) \subset X - S I\delta s -int(FA).$$

$$(2) S I\delta s -int(FA - GA) \subset S I\delta s -int(FA) - S I\delta s -int(GA).$$

Proof: (1) Let $x_e \in S I\delta s -int(X - FA)$. Since $S I\delta s -int(X - FA) \subset X - FA$, implies $x_e \in FA$ and hence $x_e \notin S I\delta s -int(FA)$. This implies $x_e \in X - S I\delta s -int(FA)$. Therefore, $S I\delta s -int(X - FA) \subset X - S I\delta s -int(FA)$.

$$(2) S I\delta s -int(FA - GA) = S I\delta s -int(FA \cap X - GA) \subset S I\delta s -int(FA) \cap S I\delta s -int(X - GA) \subset S I\delta s -int(FA) \cap (X - S I\delta s -int(GA)) = S I\delta s -int(FA) - S I\delta s -int(GA).$$

Definition 4.15. A soft point x_e over X is called exterior point of FA if x_e is interior of $(X - FA)$. The set of exterior points of FA is denoted by $Ext(FA)$. That is, $Ext(FA) = int(X - FA)$.

Definition 4.16. A soft point x_e over X is called soft $S I\delta s$ -exterior point of FA if x_e is soft $S I\delta s$ -interior of $(X - FA)$. The set of soft $S I\delta s$ -exterior points of FA is denoted by $S I\delta s -E xt(FA)$. That is, $S I\delta s -E xt(FA) = S I\delta s -int(X - FA)$.

Theorem 4.17. For soft subsets FA and GA of a soft ideal topological space X the following statements hold.

$$(1) E xt(FA) \subset S I\delta s -E xt(FA).$$

$$(2) S I\delta s -E xt(FA) \text{ is soft } S I\delta s \text{-open set.}$$

$$(3) S I\delta s -E xt(X^\sim) = \emptyset \text{ and } S I\delta s -E xt(\emptyset) = X^\sim.$$

$$(4) S I\delta s -E xt(FA) \subset X - FA.$$

$$(5) S I\delta s -E xt(X - S I\delta s -E xt(FA)) = S I\delta s -E xt(FA). (6) \text{ If } FA \subset GA \text{ then } S I\delta s -E xt(GA) \subset S I\delta s -E xt(FA). (7) S I\delta s -E xt(FA) = X - S I\delta s -cl(FA).$$

$$(8) S I\delta s -E xt(FA \cup GA) \subset S I\delta s -E xt(FA) \cup S I\delta s -E xt(GA). (9) S I\delta s -E xt(FA) \cap S I\delta s -E xt(GA) \subset S I\delta s -E xt(FA \cap GA). (10) S I\delta s -Ext(S I\delta s -Ext(FA)) = S I\delta s -int(S I\delta s -cl(FA)).$$

$$(11) S I\delta s -int(FA) \subset S I\delta s -E xt(S I\delta s -E xt(FA)).$$

$$(12) FA \cap S I\delta s -E xt(FA) = \emptyset.$$

Proof: (1) For any soft subset GA over X , $int(GA) \subset S I\delta s -int(GA)$. Put $GA = X - FA$, then

$$int(X - FA) \subset S I\delta s -int(X - FA). \text{ This implies, } E xt(FA) \subset S I\delta s -E xt(FA).$$

(2) By definition, $S I\delta s -E xt(FA) = S I\delta s -int(X - FA)$ and $S I\delta s -int(X - FA)$ is soft $S I\delta s$ -open set. Therefore, $S I\delta s -E xt(FA)$ is soft $S I\delta s$ -open set.

(3) By definition, $S I\delta s -E xt(X^\sim) = S I\delta s -int(X - X^\sim) = S I\delta s -int(\emptyset) = \emptyset$ and $S I\delta s -E xt(\emptyset) =$

$$S I\delta s -int(X - \emptyset) = S I\delta s -int(X^\sim) = X^\sim.$$

$$(4) \text{ By definition, } S I\delta s -E xt(FA) = S I\delta s -int(X - FA) \subset X - FA.$$

(5) Consider $SIg\delta s - Ext(X - S Ig\delta s - Ext(FA)) = SIg\delta s - int(X - (X - S Ig\delta s - Ext(FA))) = SIg\delta s - int(SIg\delta s - Ext(FA)) = SIg\delta s - int(SIg\delta s - int(X - FA)) = SIg\delta s - int(X - FA) = SIg\delta s - Ext(FA)$.

(6) If $FA \subset GA$ then $X - GA \subset X - FA$. This implies $SIg\delta s - int(X - GA) \subset S Ig\delta s - int(X - FA)$. Therefore, $SIg\delta s - E xt(GA) \subset S Ig\delta s - E xt(FA)$.

(7) By definition, $SIg\delta s - E xt(FA) = S Ig\delta s - int(X - FA) = X - S Ig\delta s - cl(FA)$.

(8) Since, $FA \subset FA \cup GA$ and $GA \subset FA \cup GA$. By (6), $SIg\delta s - E xt(FA \cup GA) \subset S Ig\delta s - E xt(FA)$ and $SIg\delta s - E xt(FA \cup GA) \subset S Ig\delta s - E xt(GA)$. Therefore, $SIg\delta s - E xt(FA \cup GA) \subset S Ig\delta s - E xt(FA) \cup S Ig\delta s - E xt(GA)$.

(9) Since, $FA \cap GA \subset FA$ and $FA \cap GA \subset GA$. By (6), $SIg\delta s - E xt(FA) \subset S Ig\delta s - E xt(FA \cap GA)$ and $SIg\delta s - E xt(GA) \subset S Ig\delta s - E xt(FA \cap GA)$. Hence $SIg\delta s - E xt(FA) \cap S Ig\delta s - E xt(GA) \subset S Ig\delta s - E xt(FA \cap GA)$.

(10) Consider, $SIg\delta s - E xt(S Ig\delta s - E xt(FA)) = S Ig\delta s - E xt(S Ig\delta s - int(X - FA)) = S Ig\delta s - E xt(X -$

$S Ig\delta s - cl(FA)) = S Ig\delta s - int(X - (X - S Ig\delta s - cl(FA))) = S Ig\delta s - int(S Ig\delta s - cl(FA))$.

(11) Since $FA \subset S Ig\delta s - cl(FA)$, implies $SIg\delta s - int(FA) \subset S Ig\delta s - int(S Ig\delta s - cl(FA)) = S Ig\delta s - int(X - S Ig\delta s - int(X - FA)) = S Ig\delta s - E xt(S Ig\delta s - int(X - FA)) = S Ig\delta s - E xt(S Ig\delta s - E xt(FA))$. Thus, $SIg\delta s - int(FA) \subset S Ig\delta s - E xt(S Ig\delta s - E xt(FA))$.

(12) $FA \cap S Ig\delta s - E xt(FA) = FA \cap S Ig\delta s - int(X - FA) \subset FA \cap (X - FA) = \emptyset$. Therefore $FA \cap S Ig\delta s -$

$E xt(FA) = \emptyset$.

Definition 4.18. For any soft subset FA of soft ideal space X , $FA - int(FA)$ is defined as soft border of FA and is denoted by $nb(FA)$.

Definition 4.19. For any soft subset FA of soft ideal space X , $FA - S Ig\delta s - int(FA)$ is defined as soft $SIg\delta s$ -border of FA and is denoted by $SIg\delta s - nb(FA)$.

Theorem 4.20. For any soft set FA over X , the following statements hold

(1) $SIg\delta s - nb(FA) \subset nb(FA)$.

(2) $SIg\delta s - int(FA) \cap S Ig\delta s - nb(FA) = \emptyset$.

(3) FA is soft $SIg\delta s$ -open if and only if $SIg\delta s - nb(FA) = \emptyset$.

(4) $SIg\delta s - int(S Ig\delta s - nb(FA)) = \emptyset$.

(5) $SIg\delta s - nb(S Ig\delta s - int(FA)) = \emptyset$.

(6) $SIg\delta s - nb(S Ig\delta s - nb(FA)) = S Ig\delta s - nb(FA)$.

(7) $SIg\delta s - nb(FA) = FA - S Ig\delta s - int(FA) = FA \cap S Ig\delta s - cl(X - FA)$.

(8) If $FA \subset GA$ then $SIg\delta s - nb(GA) \subset S Ig\delta s - nb(FA)$.

(9) $SIg\delta s - nb(FA \cup GA) \subset S Ig\delta s - nb(FA) \cup S Ig\delta s - nb(GA)$.

(10) $SIg\delta s - nb(FA) \cap S Ig\delta s - nb(GA) \subset S Ig\delta s - nb(FA \cap GA)$.

(11) $SIg\delta s - nb(FA) = S Ig\delta s - D(X - FA)$ and $SIg\delta s - D(FA) = S Ig\delta s - nb(X - FA)$.

(12) $FA = S Ig\delta s - int(FA) \cup S Ig\delta s - nb(FA)$.

Proof: (1) Since $int(FA) \subset S Ig\delta s - int(FA) \Rightarrow X - S Ig\delta s - int(FA) \subset X - int(FA) \Rightarrow FA \cap (X - S Ig\delta s - int(FA)) \subset FA \cap (X - int(FA)) \Rightarrow FA - S Ig\delta s - int(FA) \subset FA - int(FA)$. Therefore, $SIg\delta s - nb(FA) \subset nb(FA)$.

(2) Consider $SIg\delta s - int(FA) \cap S Ig\delta s - nb(FA) = S Ig\delta s - int(FA) \cap (FA - S Ig\delta s - int(FA)) = Ig\delta s - int(FA) \cap (FA \cap (X - S Ig\delta s - int(FA))) = S Ig\delta s - int(FA) \cap (X - S Ig\delta s - int(FA)) \cap FA = \emptyset \cap FA = \emptyset$. (3) Any soft subset FA over soft ideal topological space X is soft $SIg\delta s$ -open if and only if

$FA = S Ig\delta s - int(FA) \Leftrightarrow FA - S Ig\delta s - int(FA) = \emptyset \Leftrightarrow S Ig\delta s - nb(FA) = \emptyset$.

(4) Consider, $SIg\delta s - int(S Ig\delta s - nb(FA)) = S Ig\delta s - int(FA - S Ig\delta s - int(FA)) = S Ig\delta s - int(FA \cap (X - S Ig\delta s - int(FA))) \subset S Ig\delta s - int(FA) \cap S Ig\delta s - int(X - S Ig\delta s - int(FA)) \subset S Ig\delta s - int(FA) \cap (X - S Ig\delta s - int(FA)) = \emptyset$, as $SIg\delta s - int(FA) \subset FA$. Therefore, $SIg\delta s - int(S Ig\delta s - nb(FA)) = \emptyset$.

(5) Consider, $SIg\delta s - nbd(S Ig\delta s - int(FA)) = S Ig\delta s - int(FA) - S Ig\delta s - int(S Ig\delta s - int(FA)) = S Ig\delta s - int(FA) - S Ig\delta s - int(FA) = \emptyset$.

(6) Consider $SIg\delta s - nbd(S Ig\delta s - nbd(FA)) = S Ig\delta s - nbd(FA) - S Ig\delta s - int(S Ig\delta s - nbd(FA)) = S Ig\delta s - nbd(FA)$ (because by (4)) $SIg\delta s - int(S Ig\delta s - nbd(FA)) = \emptyset$.

(7) $SIg\delta s - nbd(FA) = FA - S Ig\delta s - int(FA) = FA \cap (X - S Ig\delta s - int(FA)) = FA \cap S Ig\delta s - cl(X - FA)$. (8) If $FA \subset GA$ then $SIg\delta s - int(FA) \subset S Ig\delta s - int(GA) \Rightarrow X - S Ig\delta s - int(GA) \subset X - S Ig\delta s - int(FA) \Rightarrow FA \cap (X - S Ig\delta s - int(GA)) \subset FA \cap (X - S Ig\delta s - int(FA)) \Rightarrow FA - S Ig\delta s - int(GA) \subset FA - S Ig\delta s - int(FA) \Rightarrow S Ig\delta s - nbd(GA) \subset S Ig\delta s - nbd(FA)$.

(9) Since, $FA \subset FA \cup GA$ and $GA \subset FA \cup GA$. By (8), $SIg\delta s - nbd(FA \cup GA) \subset S Ig\delta s - nbd(FA)$ and $SIg\delta s - nbd(FA \cup GA) \subset S Ig\delta s - nbd(GA)$. Therefore, $SIg\delta s - nbd(FA \cup GA) \subset S Ig\delta s - nbd(FA) \cup S Ig\delta s - nbd(GA)$.

(10) Since $FA \cap GA \subset FA$ and $FA \cap GA \subset GA$. By (8), $SIg\delta s - nbd(FA) \subset S Ig\delta s - nbd(FA \cap GA)$ and $SIg\delta s - nbd(GA) \subset S Ig\delta s - nbd(FA \cap GA)$. Therefore, $SIg\delta s - nbd(FA) \cap S Ig\delta s - nbd(GA) \subset S Ig\delta s - nbd(FA \cap GA)$.

(11) $SIg\delta s - nbd(FA) = FA - S Ig\delta s - int(FA) = FA - (FA - S Ig\delta s - D(X - FA)) = S Ig\delta s - D(X - FA)$

and $SIg\delta s - nbd(X - FA) = S Ig\delta s - D(FA)$ is obtained by replacing FA by $X - FA$.

(12) $SIg\delta s - int(FA) \cup S Ig\delta s - nbd(FA) = S Ig\delta s - int(FA) \cup (FA - S Ig\delta s - int(FA)) = S Ig\delta s - int(FA) \cup (FA \cap (X - S Ig\delta s - int(FA))) = (SIg\delta s - int(FA) \cup FA) \cap (S Ig\delta s - int(FA) \cup (X - S Ig\delta s - int(FA))) = FA \cap X = FA$. Therefore, $FA = S Ig\delta s - int(FA) \cup S Ig\delta s - nbd(FA)$.

Definition 4.21. For any soft subset FA over soft ideal topological space X , $cl(FA) - int(FA)$ is defined as soft frontier of soft set FA and is denoted by $Fr(FA)$.

Definition 4.22. For any soft subset FA over soft ideal topological space X , $SIg\delta s - cl(FA) - S Ig\delta s - int(FA)$ is defined as soft $SIg\delta s$ -frontier of set FA and is denoted by $SIg\delta s - F r(FA)$.

Theorem 4.23. For a soft subset FA over soft ideal topological space X the following results hold

- (1) $SIg\delta s - F r(FA) \subset F r(FA)$.
- (2) $SIg\delta s - nbd(FA) \subset S Ig\delta s - F r(FA)$.
- (3) $SIg\delta s - cl(FA) = S Ig\delta s - int(FA) \cup S Ig\delta s - F r(FA)$.
- (4) $SIg\delta s - int(FA) \cap S Ig\delta s - F r(FA) = \emptyset$.
- (5) $SIg\delta s - F r(FA) = S Ig\delta s - nbd(FA) \cup S Ig\delta s - D(FA)$.
- (6) FA is soft $SIg\delta s$ -open if and only if $SIg\delta s - F r(FA) = S Ig\delta s - D(FA)$.
- (7) $SIg\delta s - F r(FA) = S Ig\delta s - cl(FA) \cap S Ig\delta s - cl(X - FA)$.
- (8) $SIg\delta s - F r(FA) = S Ig\delta s - F r(X - FA)$. (9) $SIg\delta s - F r(FA)$ is soft $SIg\delta s$ -closed set.
- (10) $SIg\delta s - int(FA) = FA - S Ig\delta s - F r(FA)$.
- (11) $SIg\delta s - F r(FA) = \emptyset$ if and only if FA is soft $SIg\delta s$ -open as well as soft $SIg\delta s$ -closed.
- (12) $SIg\delta s - F r(S Ig\delta s - int(FA)) \subset S Ig\delta s - F r(FA)$.
- (13) $SIg\delta s - int(FA) \cup S Ig\delta s - int(X - FA) = X - S Ig\delta s - F r(FA)$.
- (14) $SIg\delta s - F r(S Ig\delta s - cl(FA)) \subset S Ig\delta s - F r(FA)$.
- (15) $SIg\delta s - cl(FA) = FA \cup S Ig\delta s - F r(FA)$.

Proof: (1) Since $int(FA) \subset S Ig\delta s - int(FA)$, implies $X - S Ig\delta s - int(FA) \subset X - int(FA)$. Also $SIg\delta s - cl(FA) \subset cl(FA)$. Therefore, $SIg\delta s - cl(FA) \cap (X - S Ig\delta s - int(FA)) \subset cl(FA) \cap (X - int(FA))$. This implies $SIg\delta s - cl(FA) - S Ig\delta s - int(FA) \subset cl(FA) - int(FA)$. Hence $SIg\delta s - F r(FA) \subset F r(FA)$.

(2) Since $FA \subset S \text{ Ig}\delta s \text{-cl}(FA)$, implies $FA \cap (X - S \text{ Ig}\delta s \text{-int}(FA)) \subset S \text{ Ig}\delta s \text{-cl}(FA) \cap (X - S \text{ Ig}\delta s \text{-int}(FA))$. This implies $FA - S \text{ Ig}\delta s \text{-int}(FA) \subset S \text{ Ig}\delta s \text{-cl}(FA) - S \text{ Ig}\delta s \text{-int}(FA)$. This shows, $S \text{ Ig}\delta s \text{-nbd}(FA) \subset S \text{ Ig}\delta s \text{-F r}(FA)$.

(3) $S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-F r}(FA) = S \text{ Ig}\delta s \text{-int}(FA) \cup (S \text{ Ig}\delta s \text{-cl}(FA) \cap (X - S \text{ Ig}\delta s \text{-int}(FA))) =$

$(S \text{ Ig}\delta s \text{-int}(FA) \cup (S \text{ Ig}\delta s \text{-cl}(FA))) \cap (S \text{ Ig}\delta s \text{-int}(FA) \cup (X - S \text{ Ig}\delta s \text{-int}(FA))) = S \text{ Ig}\delta s \text{-cl}(FA) \cap X^c =$

$S \text{ Ig}\delta s \text{-cl}(FA)$.

(4) $S \text{ Ig}\delta s \text{-int}(FA) \cap S \text{ Ig}\delta s \text{-F r}(FA) = S \text{ Ig}\delta s \text{-int}(FA) \cap (S \text{ Ig}\delta s \text{-cl}(FA) \cap (X - S \text{ Ig}\delta s \text{-int}(FA))) =$

$S \text{ Ig}\delta s \text{-cl}(FA) \cap (S \text{ Ig}\delta s \text{-int}(FA) \cap (X - S \text{ Ig}\delta s \text{-int}(FA))) = S \text{ Ig}\delta s \text{-cl}(FA) \cap \emptyset = \emptyset$.

(5) From (3), $S \text{ Ig}\delta s \text{-cl}(FA) = S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-Fr}(FA)$. This implies, $FA \cup S \text{ Ig}\delta s \text{-D}(FA) =$

$S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-F r}(FA)$. But $FA = S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-nbd}(FA)$... (by(12) of Theorem

4.20. Therefore $S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-nbd}(FA) \cup S \text{ Ig}\delta s \text{-D}(FA) = S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-F r}(FA)$. Hence, $S \text{ Ig}\delta s \text{-nbd}(FA) \cup S \text{ Ig}\delta s \text{-D}(FA) = S \text{ Ig}\delta s \text{-Fr}(FA)$.

(6) Suppose FA is soft $S \text{ Ig}\delta s \text{-open}$, by Theorem 4.20 $S \text{ Ig}\delta s \text{-nbd}(FA) = \emptyset$. From (5), $S \text{ Ig}\delta s \text{-F r}(FA) = S \text{ Ig}\delta s \text{-nbd}(FA) \cup S \text{ Ig}\delta s \text{-D}(FA) = S \text{ Ig}\delta s \text{-D}(FA)$. Therefore if FA is soft $S \text{ Ig}\delta s \text{-open}$, $S \text{ Ig}\delta s \text{-F r}(FA) = S \text{ Ig}\delta s \text{-D}(FA)$.

On the other hand, suppose $S \text{ Ig}\delta s \text{-F r}(FA) = S \text{ Ig}\delta s \text{-D}(FA)$. From (3), $S \text{ Ig}\delta s \text{-cl}(FA) = S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-F r}(FA)$. That is, $FA \cup S \text{ Ig}\delta s \text{-D}(FA) = S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-F r}(FA)$. That is $FA \cup S \text{ Ig}\delta s \text{-D}(FA) = S \text{ Ig}\delta s \text{-int}(FA) \cup S \text{ Ig}\delta s \text{-D}(FA)$, by hypothesis. Therefore, $FA = S \text{ Ig}\delta s \text{-int}(FA)$ and hence FA is soft $S \text{ Ig}\delta s \text{-open}$.

(7) $S \text{ Ig}\delta s \text{-F r}(FA) = S \text{ Ig}\delta s \text{-cl}(FA) - S \text{ Ig}\delta s \text{-int}(FA) = S \text{ Ig}\delta s \text{-cl}(FA) \cap (X - S \text{ Ig}\delta s \text{-int}(FA)) = S \text{ Ig}\delta s \text{-cl}(FA) \cap S \text{ Ig}\delta s \text{-cl}(X - FA)$.

$\cap S \text{ Ig}\delta s \text{-cl}(X - FA)$.

(8) Now $S \text{ Ig}\delta s \text{-F r}(X - FA) = S \text{ Ig}\delta s \text{-cl}(X - FA) - S \text{ Ig}\delta s \text{-int}(X - FA) = (X - S \text{ Ig}\delta s \text{-int}(FA)) -$

$(X - S \text{ Ig}\delta s \text{-cl}(FA)) = S \text{ Ig}\delta s \text{-cl}(FA) - S \text{ Ig}\delta s \text{-int}(FA) = S \text{ Ig}\delta s \text{-F r}(FA)$.

(9) A soft subset FA of X is soft $S \text{ Ig}\delta s \text{-closed}$ if and only if $S \text{ Ig}\delta s \text{-cl}(FA) = FA$. Consider $S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-F r}(FA)) = S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-cl}(FA) - S \text{ Ig}\delta s \text{-int}(FA)) = S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-cl}(FA) \cap (X - S \text{ Ig}\delta s \text{-int}(FA))) = S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-cl}(FA) \cap S \text{ Ig}\delta s \text{-cl}(X - FA)) \subset S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-cl}(FA)) \cap S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-cl}(X - FA)) = S \text{ Ig}\delta s \text{-cl}(FA) \cap S \text{ Ig}\delta s \text{-cl}(X - FA) = S \text{ Ig}\delta s \text{-F r}(FA)$by (7).

Thus, $S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-F r}(FA)) \subset S \text{ Ig}\delta s \text{-F r}(FA)$. But $S \text{ Ig}\delta s \text{-F r}(FA) \subset S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-F r}(FA))$ is always true. Therefore $S \text{ Ig}\delta s \text{-cl}(S \text{ Ig}\delta s \text{-F r}(FA)) = S \text{ Ig}\delta s \text{-F r}(FA)$ and hence $S \text{ Ig}\delta s \text{-F r}(FA)$ is soft $S \text{ Ig}\delta s \text{-closed}$ set.

(10) $FA - S \text{ Ig}\delta s \text{-F r}(FA) = FA \cap (X - S \text{ Ig}\delta s \text{-F r}(FA)) = FA \cap (S \text{ Ig}\delta s \text{-cl}(FA) \cap S \text{ Ig}\delta s \text{-cl}(X - FA))^c = FA \cap ((S \text{ Ig}\delta s \text{-cl}(FA))^c \cup (S \text{ Ig}\delta s \text{-cl}(X - FA))^c) = (FA \cap (S \text{ Ig}\delta s \text{-cl}(FA))^c) \cup (FA \cap (S \text{ Ig}\delta s \text{-cl}(X - FA))^c) = \emptyset \cup (FA \cap S \text{ Ig}\delta s \text{-int}(FA)) = S \text{ Ig}\delta s \text{-int}(FA)$.

(11) If FA is both soft $S \text{ Ig}\delta s \text{-open}$ and soft $S \text{ Ig}\delta s \text{-closed}$ set, then $S \text{ Ig}\delta s \text{-int}(FA) = FA$ and $S \text{ Ig}\delta s \text{-cl}(FA) = FA$ respectively. Now $S \text{ Ig}\delta s \text{-F r}(FA) = S \text{ Ig}\delta s \text{-cl}(FA) - S \text{ Ig}\delta s \text{-int}(FA) = FA - FA = \emptyset$.

Conversely, $S \text{ Ig}\delta s \text{-F r}(FA) = \emptyset \Rightarrow S \text{ Ig}\delta s \text{-cl}(FA) - S \text{ Ig}\delta s \text{-int}(FA) = \emptyset \Rightarrow S \text{ Ig}\delta s \text{-cl}(FA) \subset S \text{ Ig}\delta s \text{-int}(FA) \subset FA$. That is $S \text{ Ig}\delta s \text{-cl}(FA) \subset FA$. But $FA \subset S \text{ Ig}\delta s \text{-cl}(FA)$ is always true. Therefore $S \text{ Ig}\delta s \text{-cl}(FA) = FA$. Hence FA is soft $S \text{ Ig}\delta s \text{-closed}$ set. Again $S \text{ Ig}\delta s \text{-F r}(FA) = \emptyset \Rightarrow S \text{ Ig}\delta s \text{-cl}(FA) - S \text{ Ig}\delta s \text{-int}(FA) = \emptyset$, $S \text{ Ig}\delta s \text{-cl}(FA) \subset S \text{ Ig}\delta s \text{-int}(FA) \Rightarrow FA \cup S \text{ Ig}\delta s \text{-D}(FA) \subset S \text{ Ig}\delta s \text{-int}(FA) \Rightarrow FA \subset S \text{ Ig}\delta s \text{-int}(FA)$. But $S \text{ Ig}\delta s \text{-int}(FA) \subset FA$.

$\text{int}(FA) \subset FA$ is always true. Therefore $FA = S \text{Igd}s - \text{int}(FA)$. Hence FA is soft $S \text{Igd}s$ -open set.

(12) $S \text{Igd}s - F r(S \text{Igd}s - \text{int}(FA)) = S \text{Igd}s - \text{cl}(S \text{Igd}s - \text{int}(FA)) - S \text{Igd}s - \text{int}(S \text{Igd}s - \text{int}(FA)) \subset S \text{Igd}s - \text{cl}(FA) - S \text{Igd}s - \text{int}(FA)$ as $S \text{Igd}s - \text{int}(FA) \subset FA$. This implies $S \text{Igd}s - F r(S \text{Igd}s - \text{int}(FA)) \subset S \text{Igd}s - F r(FA)$.

(13) Consider $X - S \text{Igd}s - F r(FA) = X - (S \text{Igd}s - \text{cl}(FA) - S \text{Igd}s - \text{int}(FA)) = (X - S \text{Igd}s - \text{cl}(FA)) \cup$

$S \text{Igd}s - \text{int}(FA) = S \text{Igd}s - \text{int}(X - FA) \cup S \text{Igd}s - \text{int}(FA)$.

(14) $S \text{Igd}s - F r(S \text{Igd}s - \text{cl}(FA)) = S \text{Igd}s - \text{cl}(S \text{Igd}s - \text{cl}(FA)) - S \text{Igd}s - \text{int}(S \text{Igd}s - \text{cl}(FA)) = S \text{Igd}s - \text{cl}(S \text{Igd}s - \text{cl}(FA)) \cap (X - S \text{Igd}s - \text{int}(S \text{Igd}s - \text{cl}(FA))) = S \text{Igd}s - \text{cl}(FA) \cap S \text{Igd}s - \text{cl}(X - S \text{Igd}s - \text{cl}(FA)) \dots (1)$. Also, $FA \subset S \text{Igd}s - \text{cl}(FA) \Rightarrow X - S \text{Igd}s - \text{cl}(FA) \subset X - FA \Rightarrow S \text{Igd}s - \text{cl}(X - S \text{Igd}s - \text{cl}(FA)) \subset S \text{Igd}s - \text{cl}(X - FA)$. Substituting in (1), $S \text{Igd}s - F r(S \text{Igd}s - \text{cl}(FA)) \subset S \text{Igd}s - \text{cl}(FA) \cap S \text{Igd}s - \text{cl}(X - FA) = S \text{Igd}s -$

$F r(FA)$. Thus, $S \text{Igd}s - F r(S \text{Igd}s - \text{cl}(FA)) \subset S \text{Igd}s - F r(FA)$.

(15) From (3), $S \text{Igd}s - \text{cl}(FA) = S \text{Igd}s - \text{int}(FA) \cup S \text{Igd}s - F r(FA) \subset FA \cup S \text{Igd}s - F r(FA) \dots (1)$ as $S \text{Igd}s - \text{int}(FA) \subset FA$. Also from (3), $S \text{Igd}s - F r(FA) \subset S \text{Igd}s - \text{cl}(FA)$ and $FA \subset S \text{Igd}s - \text{cl}(FA)$ is always true. Therefore, $FA \cup S \text{Igd}s - F r(FA) \subset S \text{Igd}s - \text{cl}(FA) \dots (2)$. From (1) and (2) it follows that, $FA \cup S \text{Igd}s - F r(FA) = S \text{Igd}s - \text{cl}(FA)$.
